

Tabletop Exercise: LockBit Ransomware Attack on Fawry

1. Overview

Title: LockBit Ransomware Compromise of Fawry's Testing Environment

Objective: Evaluate the organization's capability to detect, respond to, and recover from a ransomware attack targeting non-production systems.

Participants: Incident Response Team, IT Security Personnel, Communications Team, Legal Advisors, and Executive Leadership.

Duration: Half-day session (approximately 4 hours)

2. Scenario Summary

On November 8, 2023, Fawry experienced a ransomware incident where the LockBit group claimed responsibility for encrypting and stealing data from its isolated testing environment. The attackers published a sample of the compromised data on a leak site. Although production environments remained unaffected, the exposed data reportedly included customer information. Fawry engaged forensic experts to investigate and contain the breach. The incident raised significant concerns about data security and incident response readiness.

3. Exercise Phases and Injects

Phase	Time	Inject	Expected Actions
Preparation	09:00 AM	Unusual behavior is detected within the testing environment during routine monitoring.	Ensure incident response documentation is available and team roles are confirmed. Validate monitoring and alerting systems.
Identification	09:30 AM	Multiple servers begin showing signs of unauthorized access and file encryption.	Classify the incident based on impact and scope. Begin documentation and notify relevant team leads.
Containment	10:00 AM	Encryption activity confirmed on test servers. LockBit ransomware variant suspected.	Segment and isolate affected systems. Block outgoing connections and review firewall

			policies.
Eradication	11:00 AM	Digital forensics confirms ransomware presence. No production data affected.	Remove malicious components, patch systems, and reset credentials. Verify removal through malware scans.
Recovery	01:00 PM	Clean backups are restored. No persistence detected.	Validate system functionality and conduct integrity checks. Monitor systems post-restoration.
Lessons Learned	03:00 PM	Debriefing session held with all stakeholders.	Document incident timeline, identify gaps, update the IRP, and recommend training if needed.

Impact of LockBit Ransomware Attack on Fawry

Note: Values are approximate and for demonstration purposes.

4. Evaluation Criteria

Category	Evaluation Metric
Detection	Speed and accuracy of identifying the ransomware incident.
Response	Efficiency of containment and mitigation measures.
Communication	Clarity and timeliness of both internal and external communications.
Recovery	Effectiveness of system restoration and validation processes.
Post-Incident	Quality of insights gathered and updates applied to the IRP.

5. Resources Required

- - Access to the current Incident Response Plan (IRP).
- - Detailed diagrams of system and network infrastructure.
- - Communication templates for stakeholders and regulators.
- - Documented backup and recovery procedures.
- - Credentials to access testing environment tools and logs.
